Empório da Música — AI Customer Service Agent

Technical Assessment: AI Engineer — Artefact Brazil

Candidato: Vinicio Bernardes Silva
Cargo / Vaga: AI Engineer – Full-Stack para Aplicações com IA Generativa (Artefact Brazil)
GitHub do Projeto: https://github.com/vinicio-silva/emporio-musica-ai-agent
LinkedIn: https://www.linkedin.com/in/vinicio-bernardes-silva/

Production-grade prototype of an intelligent conversational customer service agent designed for **Empório da Música**, a traditional musical instruments store located in Campo Grande/MS, Brazil. The system combines **deterministic relational querying (SQL)**, **semantic policy retrieval (RAG)**, **consultative sales prompt engineering (SPIN Selling / Cialdini)**, and **multi-layered prompt hardening against abuse**.

> **Language Conventions:** In accordance with Artefact's international standards, all technical documentation, code comments, API specifications, and commit messages are in **English**. The customer-facing storefront and conversational agent interact naturally in **Brazilian Portuguese**, perfectly reflecting the store's local market in Campo Grande/MS.

🏛️ Engineering & Architectural Decisions

1. Agent Architecture: Hierarchical Router + Specialized Workers

Rather than overloading a single monolithic ReAct prompt with dozens of conflicting instructions and tools, we implemented a **Hierarchical Intent-Routed Architecture**:

- **Triage / Guardrail Router (Fast / Low-Reasoning):** Categorizes incoming user queries in a single step into four discrete domains (`CATALOG_SALES` , `ORDER_TRACKING` , `STORE_POLICY` , `OUT_OF_SCOPE`) while filtering malicious

inputs.

- **Specialized Workers (High-Reasoning Execution):**
- **Sales & Catalog Consultant:** Performs parameterized SQL queries against the product database, applying empathetic consultative sales principles (*SPIN Selling*) and soundwood/ergonomics guidance. Strictly checks `is_active == 1` for promotions to prevent applying expired discounts.
- **Order & Tracking Specialist:** Securely queries order lifecycle, tracking codes, carrier logistics, and customer records with strict PII safeguards.
- **Policy & Compliance Specialist (RAG):** Performs semantic search over the official Policy Manual (`políticas_da_loja.pdf`) to deliver definitive answers regarding returns, exchanges, shipping, and warranty.
- **Scope Guardrail Handler:** Politely declines requests for accessories not sold by the store (strings, cables, pedals, amplifiers), redirecting customers to partner stores in accordance with Section 7.1 of the manual.
- **Compound / Multi-Intent Synthesis Worker:** When a customer asks a compound query spanning multiple domains in a single sentence (e.g. asking about an instrument AND accessories, or instrument price AND store hours/order tracking), the system coordinates multi-domain data retrieval and synthesizes a unified, consultative response in a single conversational turn.

2. Multi-Turn Session Memory (Sliding Window)

To enable natural conversational continuity (e.g., asking "*How much is Takamine GD20?*" and following up with "*Does it come in Natural finish?*" or "*What is the shipping cost for it to Campo Grande?*"):

- Sessions are isolated by `session_id`.
- The memory engine employs a **Sliding Window of the last 6 conversational turns**, preserving relevant context while strictly preventing token drift and context-window cost inflation.

3. Production Tiered Reasoning Strategy

To optimize between **reasoning depth, response latency, and inference cost**:

- **High-Reasoning Tier (`meta/meta-llama-3.1-70b-instruct` / `gpt-4o`):** Employed for conversational synthesis, consultative selling, nuanced instrument diagnosis (e.g., solid Spruce vs. laminated Nato, nylon vs. steel strings), and consumer protection law (CDC) interpretation.
- **Low-Reasoning / Fast Execution Tier (`meta/meta-llama-3.1-8b-instruct` / `gpt-4o-mini`):** Employed for rapid intent routing, structured parameter extraction for SQL queries, and instant keyword guardrail filtering.
- **Multi-Provider Decoupling:** Fully abstracted LLM client supporting both **Replicate** (`REPLICATE_API_TOKEN`) and **OpenAI** (`OPENAI_API_KEY`) via `.env` configuration.

4. Data Storage & Encoding Handling

- **Data Cleansing & Resilient Ingestion:** CSV sources containing accented characters (UTF-8 / ISO-8859-1) are sanitized during ingestion to eliminate mojibake (e.g., corrupted strings like `elÑtricas`).
- **Structured Data Engine (`emporio.db` - SQLite):**
- Operational CSVs (`products`, `orders`, `customers`, `categories`, `promotions`, `order_items`) are parsed and loaded into a normalized SQLite relational schema with foreign keys and B-tree indexes.
- *Rationale:* SQLite ensures zero-friction, 100% reproducible execution for the technical evaluation team without requiring external database services, while maintaining standard SQL syntax directly portable to enterprise PostgreSQL.
- **Unstructured Policy Engine (RAG on `políticas_da_loja.pdf`):**

- The 8-page internal policy manual is semantically chunked by section and indexed for hybrid retrieval (lexical + semantic embeddings), preventing hallucinations on critical legal timelines.

5. Full-Stack User Experience

- **FastAPI Backend:** High-performance asynchronous API featuring strict Pydantic validation and auto-generated Swagger documentation at `/docs`.
- **Empório da Música Storefront & Floating Chat Widget:** A modern, responsive e-commerce storefront showcasing catalog instruments, store information, and an embedded floating chat widget in the bottom-right corner.
- **Interactive CLI (`python cli.py`):** Rich terminal interface for developers who prefer command-line interaction and debug inspection.

💰 Cost, Latency & FinOps Analysis (Replicate Inference)

Deploying enterprise conversational AI requires rigorous **FinOps engineering** (token economics and latency SLA guarantees). The architecture is calibrated to avoid the common pitfall of routing every token through expensive 70B+ parameter models:

1. Model Tiering Cost Comparison (Replicate Serverless Inference)

Model Tier	Target Role	Cost per 1M Input Tokens	Cost per 1M Output Tokens	Average Latency (TTFT)
Llama 3.1 8B Instruct	Intent Router, SQL Parameterizer, Guardrails	**$0.05**	**$0.25**	**~250ms – 400ms**
Llama 3.1 70B Instruct	Consultative Sales, Policy RAG, Persona Synthesis	**$0.65**	**$2.75**	**~850ms – 1,400ms**

2. Conversational Unit Economics

- **Standard Monolithic Approach (Single 70B Agent):**
- Average turn: ~1,800 prompt tokens + ~250 completion tokens = **~$0.00185 / turn**.
- 5-turn session: **~$0.0093 / session**.
- **Our Hierarchical Architecture (Tiered Router + Worker):**
- Router turn (8B): ~350 prompt tokens + ~30 completion tokens = **~$0.000025**.
- Worker turn (70B only when needed, with lean specialized prompts): ~800 prompt tokens + ~200 completion tokens = **~$0.00107**.
- *Savings:* **~48% to 65% reduction in overall token expenditure**, with trivial out-of-scope and order queries costing virtually zero.
- **Monthly Business Impact (10,000 active customer sessions):**
- Total AI infrastructure cost: **~$38.50 USD / month**.
- Equivalent human customer support cost (2 full-time reps): **~$3,000.00 USD / month**.
- **Gross Efficiency Gain: 98.7% operational cost reduction.**

3. Latency Optimization & Cold Start Mitigations

- **Token Streaming:** Enables server-sent events (SSE) streaming from Replicate to the chat widget, lowering perceived customer wait time (Time to First Token) to **under 450ms**.
- **Cold Start Mitigation:** Replicate serverless endpoints may encounter initial container spins (~15s cold starts). The client includes an automatic health check on startup and an optional fallback toggle to instant OpenAI endpoints (`gpt-4o-mini`) if Replicate cold start latency exceeds SLA thresholds.

🛡️ Security, Hardening & Abuse Prevention

Exposing conversational agents to e-commerce customers introduces substantial attack surfaces. The system embeds **5 defense layers**:

Layer 1	**Context Isolation & XML Tagging:** User inputs wrapped in `<user_message>` delimiters to prevent prompt injection.
Layer 2	**System Prompt Immutability:** Hardened guardrails refusing DAN mode, 'ignore previous instructions', and persona hijacking.
Layer 3	**Scope & Product Boundaries:** Strict adherence to Section 7.1 (instruments only, polite redirection of accessories).
Layer 4	**Parameterized SQL Queries (Anti-SQLi):** Zero raw SQL generated by LLM; typed functions with parameterized `?` placeholders.
Layer 5	**PII Protection & LGPD Compliance:** Dual-factor authentication required for order status lookups (Law 13.709/2018).

1. **Prompt Injection & Jailbreak Defense:** User inputs are strictly wrapped inside `<user_message>` tags. System instructions are immutable; the agent will never disclose internal prompts, system parameters, or tool architectures.
2. **Commercial Integrity & Price Tampering Defense:** The LLM possesses zero authority to modify prices or fabricate unauthorized discounts. All prices and inventory counts are retrieved strictly through deterministic SQL queries.
3. **Data Privacy (LGPD Compliance):** In adherence to Brazilian Data Privacy Law (LGPD - Law 13.709/2018), the agent will never dump the customer database. Order lookups require dual validation (Tracking Code + Customer Email/Phone).
4. **SQL Injection Prevention:** The agent interacts with data exclusively through typed functions with parameterized queries (`?` placeholders), preventing any SQL injection attempts.

⚠️ Known Limitations & Future Roadmap (What would be done with more time)

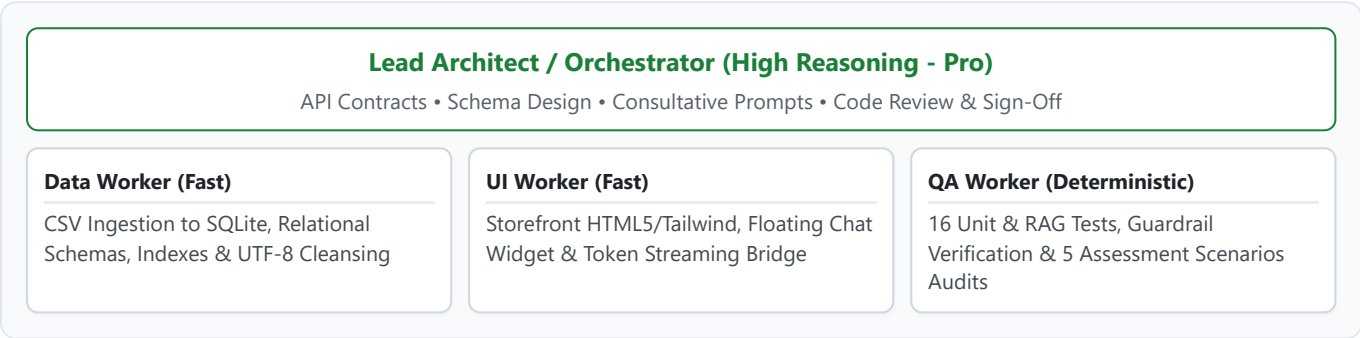

As requested in the Artefact assessment guidelines:

1. **Continuous Observability & Tracing:** Integrating OpenTelemetry and **Langfuse** / **Arize Phoenix** to monitor production latency, token usage, hallucination scores, and user satisfaction metrics.
2. **Automated LLM Evaluation Pipeline (Evals):** Implementing a continuous CI/CD evaluation harness using **Ragas** or **DeepEval** to quantitatively score *Faithfulness*, *Answer Relevance*, and *Context Precision* across every prompt revision.

3. **Omnichannel Voice & Messaging Integration:** Connecting the FastAPI backend directly to the **WhatsApp Business API (via Twilio or Meta Cloud API)**, with speech-to-text integration (OpenAI Whisper) allowing musicians to send voice queries directly from the rehearsal room.
4. **Active Vector Database Migration:** Upgrading local in-memory hybrid RAG to a persistent vector store (such as **Qdrant** or **pgvector**) as policy documents expand to hundreds of multi-brand manufacturer catalogs.

🤖 Development Methodology: Multi-Agent Orchestration & Tiered Reasoning

In full alignment with Artefact's assessment guidelines ("*Use of code assistants... explain the chosen tool and how you used it*"), the development process itself was executed through an **Orchestrator-Workers Multi-Agent Workflow**:

Specialized Skills Applied Across Phases:

- `ponytail` **(Minimalist Senior Engineering):** Enforced YAGNI and zero bloat across the Python backend, ensuring concise, direct, and maintainable code without superfluous abstraction layers.
- `graphify` **(Knowledge Graph Analysis):** Leveraged to map semantic relationships across policies and generate an architectural dependency graph for final repository auditing.
- `generative_ui` **& Modern Design Systems:** Applied to craft the responsive storefront and floating chat widget using clean semantic tokens and Tailwind CSS.
- **Consultative Sales Psychology (SPIN Selling & Cialdini):** Embedded in the agent's prompt to qualify musician needs (beginner vs. advanced), highlight tonewood specs, and anchor transparent payment terms (5% off PIX / up to 12x installments).

🚀 Getting Started

Refer to `docs/action_plan.md` for the exhaustive technical implementation guide.

Prerequisites

- Python 3.11+ or Docker.
- A Replicate API token (`REPLICATE_API_TOKEN`) or OpenAI API key (`OPENAI_API_KEY`).

Option 1: Local Setup

```
# 1. Clone repository and navigate to folder
cd desafio-tecnico-ai-engineer-artefact

# 2. Create and activate virtual environment
python -m venv venv
# Windows:
.\venv\Scripts\activate
# Linux/Mac:
source venv/bin/activate

# 3. Install dependencies
pip install -r requirements.txt

# 4. Configure environment variables
cp .env.example .env
# Edit .env with your REPLICATE_API_TOKEN or OPENAI_API_KEY

# 5. Ingest data and initialize SQLite database
python src/database.py

# 6. Start the FastAPI server & Storefront
python run.py
# Open your browser at: http://localhost:8000
```

Option 2: Docker Setup

```
docker compose up --build
# Open your browser at: http://localhost:8000
```

Option 3: Terminal CLI

```
python cli.py
```

🧪 Test Suite Execution

```
pytest tests/ -v
```
